ELITE LIQUID DEFOAMER MACHINE RECOVERY TANK ADDITIVE

- High Dilution Rate
- Non-foaming
- Minimises Downtime

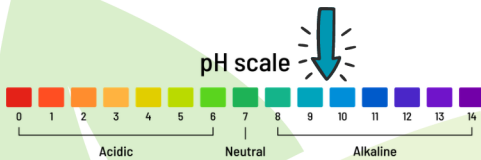

Description:

ELITE Defoamer 5L is a specialised de-foaming agent developed for use in the recovery tanks of cleaning machines. It helps control foam created by the detergent in use, while also counteracting excess foaming caused by residues from previous cleaning products.

By reducing foam build-up, it allows recovery tanks to operate more efficiently and reach full working capacity, helping minimise interruptions and foam-related shut-offs during cleaning. Ideal for carpet extraction machines, wet vacuums and scrubber dryers, it supports smoother machine performance in demanding environments. The product is added directly to the recovery tank, with a typical dilution rate of 500:1, although this can be increased where severe foaming is expected.

Supplied as an off-white, miscible liquid with a barely perceptible odour and a concentrate pH of 9.5 - 10.5.

Useful Information:

Product Code:	2505
Product Colour:	White
Product Fragrance:	Almost Odourless
pH Level:	9.5 - 10.5

Directions:

Defoamer should be added directly to the recovery tank of the cleaning machine before or during use to help control foam generated by detergents and any residual product left within the system.

A typical dilution rate of 500:1 is recommended, although the dosage may be increased where severe foaming is anticipated. The product is suitable for use in carpet extraction machines, wet vacuums and scrubber dryers, helping recovery tanks operate more efficiently and reach full working capacity by reducing foam-related disruption.

When handling and using the product, suitable protective gloves and eye protection should be worn.
